DESIGN HANDOFF DOCUMENT

SecureVault Dashboard

Enterprise Cloud Security File Explorer for nested legal, finance, security, and shared records.

DESIGNED AND IMPLEMENTED BY

Michael Yaw Wiafe Owusu

React + TypeScript implementation converted into a submission-ready UI/UX design deliverable.

Business Problem

Why this product exists

Law firms and banks often manage sensitive records inside deeply nested folder structures. A flat file list can cause reviewers to miss evidence, cite the wrong version, or copy incomplete paths into compliance workflows.

SecureVault solves this by combining a recursive tree, metadata inspection, exact breadcrumb path copying, search, and frontend-only file actions in a focused dashboard.

extensions

Primary audiences

- Legal reviewers validating internal case evidence paths.
- Banking and compliance teams auditing secure document structures.
- Security teams inspecting configuration files and incident records.
- Enterprise users who need fast keyboard-based file navigation.

Cyber-secure Enterprise Interface

Dark mode first

Default visual language uses dark navy-black surfaces, secure green accents, thin borders, and glow tokens to suggest protected systems without turning the UI into a game-like theme.

Fast scanning

KPI cards summarize the vault at the top. The explorer uses indentation, file labels, disclosure controls, and compact row heights for quick scanning.

Risk-aware actions

Trash, delete, and restore actions are visually separated. Permanent deletion uses danger styling and a confirmation modal.

Layout principles

- Header and status row establish workspace trust.
- KPI cards communicate vault size before interaction.
- Breadcrumb path remains close to the explorer for exact file referencing.
- Properties and Trash panels stay on the right for inspection and recovery tasks.
- Mobile keeps the same hierarchy but collapses controls into denser responsive surfaces.

Spacing, radius, glow

TOKEN	VALUE	USE
space-1	4px	micro gaps
space-3	12px	compact controls
space-5	20px	panel padding
radius	8px	cards/buttons
shadow	50px	raised panels
glow	accent	secure focus

Typography scale

STYLE	SIZE	WEIGHT	USAGE
Display	1.35rem	700	Product title
Section title	1.05rem	700	Panel titles
Body	1rem	400	Readable text
Tree row	0.93rem	500	Files and folders
Metadata	0.86rem	400	Paths and values
Label	0.72rem	800	Badges and eyebrows

Interactive States

PDF

Default file

Standard dark surface, muted metadata, thin border.

DOC

Hover row

Blue-tinted feedback on interactive rows.

XLS

Selected file

Green accent indicates active file details.

TXT

Focused row

Visible focus ring supports keyboard users.

DIR

Folder destination

Amber and green treatment marks import target.

>

Expanded folder

Disclosure rotates and children render below.

CPY

Disabled copy

Muted until a file or folder is selected.

DEL

Danger delete

Risk red styling for irreversible actions.

Implemented UI Screenshots

Light Mode Variant

The implemented theme toggle switches the same information architecture into a light enterprise review mode. The frame below documents the intended light-mode token mapping.

Breadcrumb path

Shows exact SecureVault internal path.

/SecureVault/Legal/2026

Primary actions

Copy path and Import to Vault are high-frequency commands.

Import to Vault

Properties panel

Name, type, size, child count, internal path, rename and file actions.

Name / Type / Size / Internal path

Trash panel

Recoverable files with restore and permanent delete actions.

Restore

Delete

Modal and toast

Deletion confirmation and temporary status notifications.

Delete file permanently?

File moved to Trash. Undo

Behavior Model

Recursive file tree

Each folder row can render child `TreeNode` rows when its ID exists in `expandedIds`. This supports arbitrary nesting without hardcoded levels.

File selection

Selecting a file sets `selectedItem`, highlights the file row, enables copy path, and renders file metadata/actions in the Properties panel.

Folder selection

Selecting a folder marks it as the import destination and changes the row styling to the folder destination state.

Keyboard navigation

The visible tree is flattened into a linear list. Arrow keys move focus, ArrowRight expands, ArrowLeft collapses, and Enter selects.

Debounced search

The input updates immediately, but recursive filtering waits 300ms. Matching folders auto-expand so results are visible.

Breadcrumb and copy path

The selected path is formatted as an internal SecureVault path and copied with Clipboard API fallback.

Import to Vault

The browser file picker creates a frontend-only `FileNode` and inserts it into the selected folder or root vault.

Trash and delete

Move to Trash preserves original path for restore. Delete Permanently requires confirmation and removes the item from demo state.

Keyboard and Screen Reader Support

Implemented controls

- `role="tree"` on the file explorer container.
- `role="treeitem"` on recursive file and folder rows.
- `aria-expanded` on folders.
- `aria-selected` on selectable rows.
- Roving `tabIndex` keeps keyboard focus predictable.

Navigation keys

- ArrowDown moves to the next visible item.
- ArrowUp moves to the previous visible item.
- ArrowRight expands the focused folder.
- ArrowLeft collapses the focused folder or moves to parent.
- Enter selects the focused file or folder.
